# Open BP Review Assistant — wire diagram (revised)

Ngawang Tselha · EPID 695/895 · Session 5

*Edge labels give the datatype passed between nodes. Labels with an arrow from above are data assets (config.yaml, message_templates.json) read in by glue code. Inputs are synthetic or approved de-identified data only. Adherence and threshold rules come from the cited statements; my code only implements them and is unit-tested against them. The LLM step is disposable because its prompt is mine; only the model itself is cited.*
